## Summary for O1(SQ001)[How many points would you give the training on a scale from 1 to 10?]

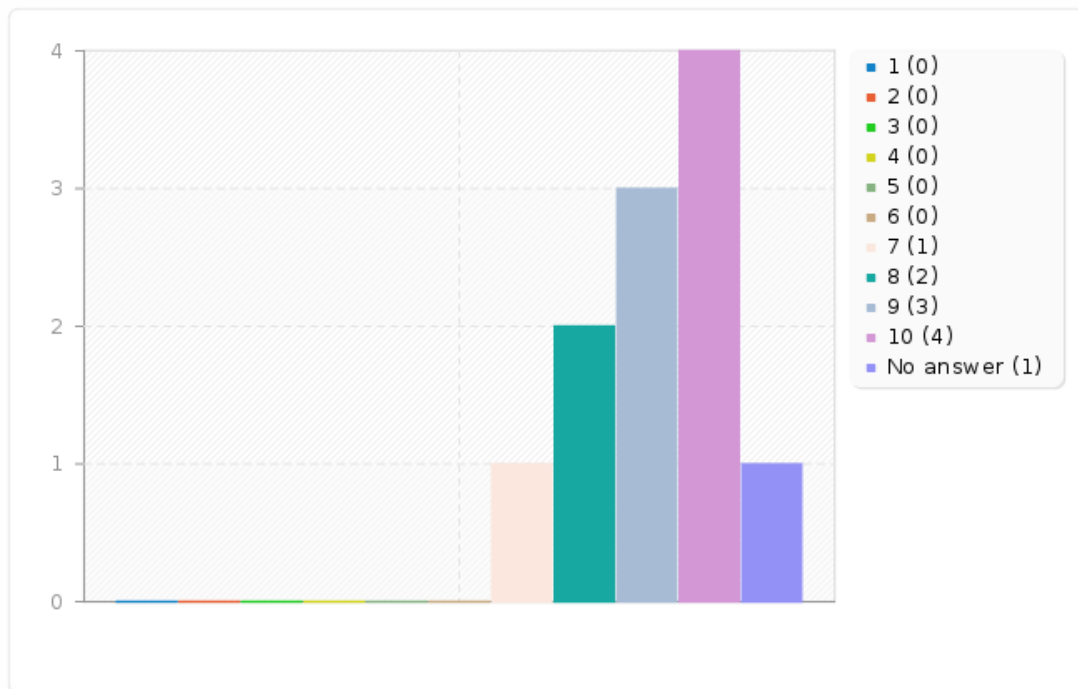

Feedback training First, we are interested in your overall rating for this offer. After that, please indicate to what extent you agree with the statements regarding the fit of the offer.

---

Answer	Count	Percentage
1 (1)	0	0.00%
2 (2)	0	0.00%
3 (3)	0	0.00%
4 (4)	0	0.00%
5 (5)	0	0.00%
6 (6)	0	0.00%
7 (7)	1	9.09%
8 (8)	2	18.18%
9 (9)	3	27.27%
10 (10)	4	36.36%
No answer	1	9.09%

9	There was a lot of statistical content - I'd prefer more information on how to use R rather than lots of extemporising on statistical theory. This is just a preference so that I could get more practical use out of the course.
11	R is a language very suitable for e.g. statistical analysis and linear modelling, but also great and simple display of data. It differs a lot from Python and Matlab, but offers plenty advantages, so including R in many data pipelines can be very useful.  Maybe I went into this course with wrong expectations, as I did not expect another statistics course, but a programming course focused on R that contains statistics.  Overall, I think this course is good and I have a positive impression from it. The instructor is knowledgeable and kind, explaining things well and going into details to explain to students. But I would not recommend it to my specific peers, as it glosses over things that I experience to be essential to my area of research, which uses very large datasets with many levels of data.  I think that explaining complex statistics with small datasets is a bit of a missed opportunity for a coding course. Many scientists will work with small datasets, but many will work with huge datasets. But as I understand, R is suitable for working with this kind of data, if approached in the correct way.  In order to work with big(ish) data, and/or become a more competent programmer, one needs to understand the underlying concepts of R. How efficient is it? Best way to read/write data? Only csv and excel or are there alternatives? How much memory will be used by what kind of operation? How to improve your code in regards to efficiency? How to develop shared codebases? How to follow good coding practices by using e.g. reusable functions? What are common pitfalls? Sentences such as 'R follows copy-on-modify semantics and thus has a different way of interacting with data than Python' is an important concept for an audience where most people already code in Python and Matlab. Or maybe 'data processing like this leads to increased memory consumption, but it is very fast and maintainable. If you are limited by Memory, you could rewrite it like this....'. Or, 'Consider changing your datatypes like this, as the internal representation of strings as data-levels is much more memory efficient and is faster to index'. 'If you have a very large dataframe, consider splitting it like this for faster indexing', etc.  From a teaching perspective, I would recommend less talking to, and explaining to, the audience but involving them more in the process, asking questions and having more interactions. In the end, numbers are numbers, but I perceived a small cognitive dissonance of working with agricultural data in a neuroscience course. Maybe behavioral data, or some fMRI or EEG data would be more intuitive for (large?) parts of the audience.
14	Overall it was a great course! My only comment might be to encourage a bit more active participation by calling people out to provide guesses at answers. But I understand that this might take up time, and not as much content could be covered. The course instructor was very good at explaining all the concepts.
